

Errata to

Ends in Uniform Spanning Forests

Electron. J. Probab. **13**, Paper 58 (2008), 1701–1725

by RUSSELL LYONS, BENJAMIN J. MORRIS, AND ODED SCHRAMM

The definition of the wired uniform spanning forest and its variant WSF_o should use an exhaustion by induced subnetworks.

The statement of Proposition 3.1 is slightly incorrect: the phrase “there do not exist two edge-disjoint infinite paths in $\mathfrak{F}(o)$ starting at o ” should be “the tree $\mathfrak{F}(o)$ has only one end”.

The proof of Lemma 3.3 has two typos: “let M_n^j be the effective conductance from o to the exterior of G_n in G^j ” should be “let M_n^j be the effective conductance from o to the exterior of G_n in \widehat{G}_n^j ” and “Theorem 7 of Morris” should be “Theorem 6 of Morris”.
